

Acne Vulgaris

- Inflammatory disorder of pilosebaceous follicle with a 90% prevalence in adolescence and young adulthood.
 - History: often asymptomatic lesions (especially comedone), although can be tender (nodules)
 - Physical: two types of lesions, predominantly affect face, neck, chest and back
 - Noninflammatory; open (“black head”) and closed (“white head”) comedones
 - Inflammatory; papules, pustule, cysts, nodule: deep lesions (leave scars)
